

## ULTRAWAVES ULTRASOUND SYSTEM FOR IMPROVEMENT OF BIOGAS PRODUCTION ON FARMLAND BIOGAS PLANTS

# Löhndorf FBP, Germany

Figure 1: Container with system from the outside and inside (US module and pump are shown)

I. Specification of the plant	
Specification of the plant	<ul> <li>1 MW nominal capacity (CHP utilization 90–95 %)</li> <li>1 main digester (MD) à 2.205 m<sup>3</sup></li> <li>1 secondary digester (SD) à 3.000 m<sup>3</sup></li> <li>1 storage tank (S) à 6.200 m<sup>3</sup></li> </ul>
Substrate (before US application)	<ul> <li>Maize silage <ul> <li>Supply: 44.4 t/d</li> <li>Dry matter: 31–36 %</li> </ul> </li> <li>Grass silage <ul> <li>Supply: 3.4 t/d</li> <li>Dry matter: 25–28 %</li> </ul> </li> </ul>
Power production (before US application)	<ul> <li>897 kW generated power (829 kW net)</li> <li>1.313 kWh/t DM electricity yield (1.214 kWh/t DM net)</li> </ul>

### II. Objective of the ultrasound test

- Intensification of anaerobic digestion process
- Reduction of substrate input
- Increase of specific biogas yield

#### III. Installation of the Ultrawaves ultrasound system

- One ultrasound system (5 kW) was installed in July 2012
- Sonication of biomass (1.8 m<sup>3</sup>/h) which is recirculated from secondary to main digester (Figure 2)

#### IV. Results of the ultrasound treatment

- Increase of power generation by 9.5 % (Figure 3)
- Reduction of dry feeding by 5.7 %
- Decreased viscosity
- Reduction of power necessary for plant operation by 8.7 % through decreased power consumption of agitators and pumps (Figure 4)

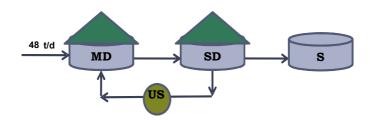

Figure 2: Flow scheme of FBP Löhndorf and integration of the ultrasound system (US)

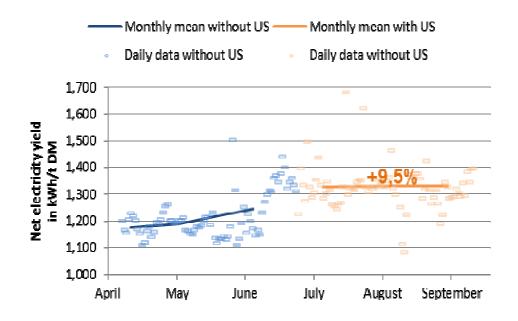

Figure 3: Net electricity yield based on dry feeding (data from 2012)

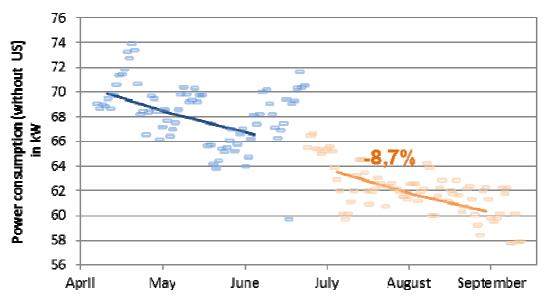

Figure 4: Power necessary for plant operation (data from 2012)
